The unique way to organize your garment dispensing extremely efficiently

Hygiene and safety standards are becoming stricter in the health care, hospitality and industrial sectors. Furthermore, the financial crisis of 2008 brought about a higher level of awareness in these trades in terms of inventory for garments. The Walk'n Closet is an innovative total solution that enables you to map and optimize the total logistics process by means of this latest new technology.

The Walk'n Closet gives you a full picture of what is happening inside your company regarding garments. In order to achieve this, we use UHF RFID technology, whereby unique garments are linked to the wearer of these garments in a very simple, fast and reliable way. Thanks to the various software applications, you are able to organize your supply and logistics processes in the most efficient manner.

How does the Walk'n Closet work?

The basic element of the Walk'n Closet is the UHF RFID tag, which is applied to each unique garment. All information from the tagged item will be read automatically by the antennas in the Walk'n Closet.

Employees will be allowed access to the Walk'n Closet by scanning their access badge. Subsequently, a big screen will indicate every employee who has garments assigned to them. Upon exiting, a UHF antenna in the Walk'n Closet automatically registers who took exactly which garment.

Entering and exiting the Walk'n Closet with the right garments takes approximately thirty seconds. In addition, several employees can be present in the Walk'n Closet at the same time. This results in **an issuance of three garments to 25 employees in three minutes.**

The Walk'n Closet software controls the entire system and stores all obtained data, thereby always providing management an exact picture of what happens to the garment in the Walk'n Closet. The data is clearly displayed in reports and graphs. This way the supply of garments can be optimized and circulating stock be minimized.

The Walk'n Closet system can be linked to the software of your laundry or textile rental company, which will keep the laundry supplier constantly up to date on the stock in the Walk'n Closet and optimizing the logistics between both. Adjustments in the

details of wearers, product and tag information are automatically passed from the Walk'n Closet to the laundry and vice versa.

A fully automated system also implies a **reduction in operational costs.** Since the sorting of garments is done by the laundry and organizing and distribution by the system, there is no one else needed to perform the issue of garments.

Why the Walk'n Closet?

This latest concept fits perfectly with our innovative nature. Since the introduction of UHF RFID tags, Textelligence has been characterized by developing innovative logistics systems and offering total solutions to laundries and their affiliates.

We are convinced that UHF technology is the method to maintain control over your garments. This technology offers the possibility of reading multiple tags from a distance in a very accurate and exact way. As a result, all information about the unique garment and individual wearers will always be up to date.

When safety and control is important

In many organizations and industries specialty or safety garments are essential. Think about the chemical industry in which wearing the proper garment may save a life or the food-processing industry where wearing clean sanitary garments may protect us all. The Walk'n Closet comes in multiple configurations to meet your specific needs in regards to dispensing requirements, security, safety and even the throughput of the number of employees.

Maximum benefit at a minimal investment

The initial investment in the Walk'n Closet is low, but the yield you will receive is high!

One of the advantages is that there is no need for construction work to implement the Walk'n Closet, versus the installation of an automatic garment dispensing machine.

A Walk'n Closet fits in an existing dressing or laundry room or can be easily adapted to the specific location and layout of your company.

Finally, the highly reliable hardware and very low maintenance costs will certainly benefit you in the long term.

Different concepts for the Walk'n Closet

Depending on your needs and preferences concerning the organization around the Walk'n Closet, you can choose the concept that fits your organization best.

- **Attended concept:** The reliable and accessible solution whereby a staff member always will be present to direct the garment dispensing. The personal contact and service granted is a great advantage. The initial investment is very low, but due to the presence of a staff member the operating costs in turn can be relatively high. A24/7 scenario often does not apply but when a personal attendant servicing you and your employees is important, this would be the perfect solution.
- **Trust concept:** The ideal solution if you are looking for a way to control the number of garments from the Walk'n Closet. The system tracks whether all garments end up with right person or not. The main reasons why companies opt for this system are the limited set-up, configuration and operational costs.
- **Secure concept:** The ultimate concept when you are looking for a fully automated and reliable garment dispensing system where all picked garments are securely scanned to the appropriate wearer. There is 100% control through the implementation of gates that only grant passage if both the wearer and related items are considered correct by the system.

In the Walk'n Closet concept we bring the wearer to the garments instead of the other way around. The Walk'n Closet helps you to dispense and manage garments at minimum cost.
